

PROJECT : Create web components for FHIR Resources

BASIC INFORMATION:

NAME : SHASHWAT
GITLAB : [shashwat](#)
GITHUB : [geforce6t](#)
FORUM : [shashwat](#)
CHAT : (shashwat)
COLLEGE : NATIONAL INSTITUTE OF TECHNOLOGY TIRUCHIRAPPALLI
DEGREE AND YEAR : BTECH, 2ND YEAR
TIMEZONE : Indian Standard Time (UTC +05:30)

PROJECT INFORMATION:

GOALS :

This project bases its goal on creating an EHR system using the webcomponents implementing FHIR resources developed during the previous versions of GSoC. For the implementation some new resource based components will be required as well which will be created simultaneously.

The plan is to use ReactJs along with Redux([Check here](#)) for state management and import and use the old and newly created Polymer components. We will be using React because of its fast and flexible features along with easily creatable PWA (Progressive Web Application).

PROJECT BACKGROUND :

An EHR is a digital real-time, patient-centered record that makes information available instantly and securely to authorized users. This involves a lot of data and information transfer requiring a standard data model for improving interoperability which is given by the FHIR (Fast Healthcare Interoperability Resources) Specification.

In the previous version of GSoC this project was based on creating web components for these FHIR resources with a goal to simplify the making of an EHR. Components for following Resources and data types have already been developed :

Resources:

- Allergy
- Location
- Medication
- Observation
- Organisation
- Patient
- practitioner

Data Types: these are the basic type based components on which a resource field depends on, creating these can reduce the extra effort to create web components separately for a field of a resource.

Components for following data types are already created:

- Coding
- Period

- Range
- ratio

The basic implementation for a resource is to create the field type web components with / without using the data type webcomponent and finally combine them to create a get/create type web component which will be ultimately used by the EHR developer.

PROJECT IMPLEMENTATION:

The procedure for implementing an EHR involves mapping an existing workflow and recreating it by the means of the EHR so that the process can be improved or simplified.

During GSoC 2018, under this project a polymer [application](#) was developed which combined all the web components (developed at that time) into a PWA, the following tabs were developed:

- Create / search patient
- Create location
- Create organisation

The current project will be built upon this application by adding and implementing workflows. Some of the key workflows that can be considered while implementing the EHR are :

- Patient check-in
- Patient visits
- e-Prescribing
- Appointment scheduling
- Laboratory orders
- Referral generation and management
- Office discharge
- Billing

This list of workflows is not exhaustive and considering the limited time we have for GSoC , the implementation of the following 5 workflows would be possible.

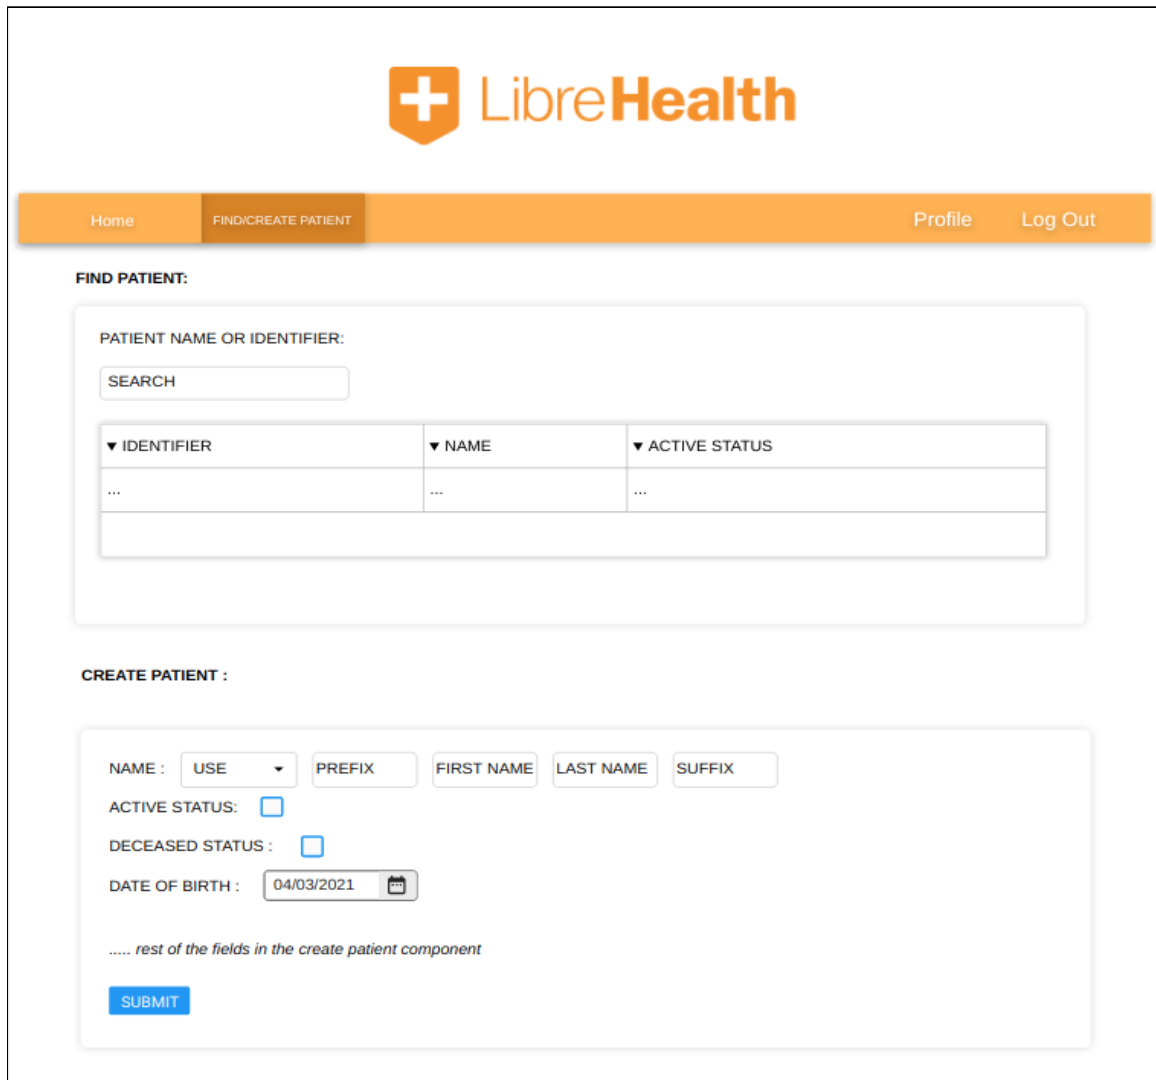

- Check-in
- Visit
- e-Prescription
- Appointment
- Lab orders

Each workflow involves professionals with different roles, so each workflow will be different for different users based on their role and privileges. For ex - during a visit the workflow of a provider will be different to that of a nurse.

Check-in : (front-desk receptionist)

The check-in workflow mainly focuses on the interaction between a patient and a front-desk receptionist. After logging into the EHR the receptionist will have the option to find a specific patient that exists in the EHR and modify/edit the patient information, else if the patient is new the receptionist can create a new patient entry into the EHR by entering the information provided by the patient. The screens below are meant for receptionists.

EDIT SAVE

In Fig 1A the patients can be searched by the name or the identifier, on clicking an entry of this search the details of the patient are shown which can be edited (Fig 1B)

Web Components used :

- fhir-create-patient
- fhir-patient-get
- fhir-search

Appointment : (Scheduler)

FHIR has a defined Scheduling workflow for the implementation of Appointments using the following resources :

- Schedule
- Slot
- Appointment

The **Schedule** resources provide a container for time-slots(Slot resource) that can be booked using an appointment; it does not provide any information about actual appointments. **Slot** resources are the time-slots that can be booked using an appointment. These define an interval status information of the Schedule resource. The **Appointment** resource has a reference to the Slot resource and contains the specifications about the appointment.

Fig 2A

The screenshot displays the LibreHealth web application interface. At the top, the LibreHealth logo is visible. Below it is a navigation bar with links: Home, SCHEDULE, SLOT, APPOINTMENT, Profile, and Log Out. The SCHEDULE link is highlighted.

Under the navigation bar, there are two main sections:

FIND SCHEDULE

This section contains a search bar labeled "SCHEDULE ACTOR OR IDENTIFIER:" with a "SEARCH" button. Below the search bar is a table with the following columns: IDENTIFIER, ACTOR, ACTIVE STATUS, and PLANNING-HORIZON. The table currently shows three rows of placeholder data (indicated by "...").

CREATE SCHEDULE

This section contains a form for creating a new schedule. The form includes the following fields and controls:

- ACTIVE :** A checkbox that is currently unchecked.
- SERVICE-CATEGORY :** A dropdown menu with "DISPLAY" selected.
- SERVICE-TYPE :** A dropdown menu with "DISPLAY" selected.
- SPECIALITY :** A dropdown menu with "DISPLAY" selected.
- ACTOR :** A dropdown menu with "REFERENCE" selected.
- PLANNING HORIZON :** Two date pickers labeled "START" and "END".
- COMMENT :** A text input field.

At the bottom of the form is a blue button labeled "CREATE SCHEDULE".

Fig 2B

The screenshot displays the LibreHealth SCHEDULER interface. At the top, the LibreHealth logo is centered. Below it is a navigation bar with buttons for Home, SCHEDULE, SLOT, APPOINTMENT, Profile, and Log Out. The SCHEDULE button is highlighted.

The main content area is divided into two sections:

FIND SLOT

SLOT STATUS OR IDENTIFIER:

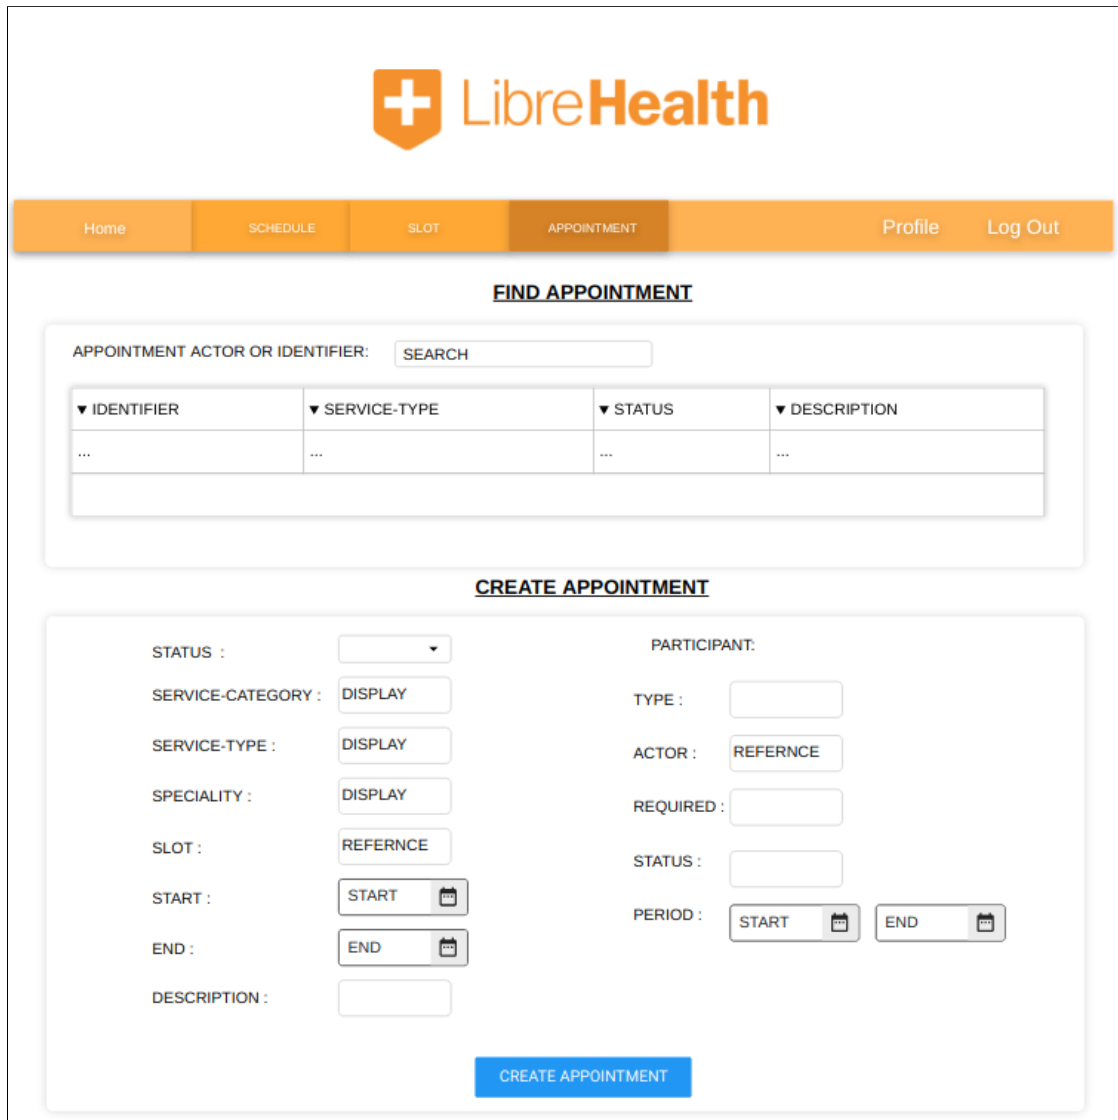

▼ IDENTIFIER	▼ START	▼ END	▼ SERVICE-TYPE
...

CREATE SLOT

STATUS :
 SERVICE-CATEGORY :
 SERVICE-TYPE :
 SPECIALITY :
 SCHEDULE :
 START :
 END :
 OVERBOOKED : ☐

The figure 2A, 2B and 2C are the EHR screens for the **scheduler**, primarily the scheduler creates a schedule resource then allocates slots which have the schedule as a reference. Fig 2A and 2B shows the screens for the creation and display of the schedule and slot based resource. The screens are in order, first the creation of a schedule component -> slot component -> appointment component. After the slots are created the scheduler can create an appointment using a slot as a reference.

Fig 2C

The screenshot displays the LibreHealth web application interface. At the top, there is a navigation bar with the LibreHealth logo and a menu containing 'Home', 'SCHEDULE', 'SLOT', 'APPOINTMENT', 'Profile', and 'Log Out'. The 'APPOINTMENT' tab is currently selected.

Below the navigation bar, the 'FIND APPOINTMENT' section is visible. It includes a search bar labeled 'APPOINTMENT ACTOR OR IDENTIFIER:' with a 'SEARCH' button. Below the search bar is a table with four columns: 'IDENTIFIER', 'SERVICE-TYPE', 'STATUS', and 'DESCRIPTION'. Each column has a dropdown arrow and a placeholder '...'. The table is currently empty.

Below the 'FIND APPOINTMENT' section is the 'CREATE APPOINTMENT' section. It contains two columns of form fields. The left column includes fields for 'STATUS', 'SERVICE-CATEGORY', 'SERVICE-TYPE', 'SPECIALITY', 'SLOT', 'START', 'END', and 'DESCRIPTION'. The right column includes fields for 'PARTICIPANT', 'TYPE', 'ACTOR', 'REQUIRED', 'STATUS', and 'PERIOD'. The 'PERIOD' field is split into 'START' and 'END' sub-fields. A blue 'CREATE APPOINTMENT' button is located at the bottom of the form.

Webcomponents required:

- Create-schedule
- Create-slot
- Create-appointment

Visit : (Nurse, Provider)

The visit workflow primarily involves the nurse and the provider along with the patient, the nurse checks the arrival of the patient, takes the vitals, verifies and creates medications and allergies.

Provider then checks the patient and performs exams and orders lab tests if necessary. FHIR does not have a visit resource so every operation related to a visit event is handled by the modified encounter resource.

In FHIR, Appointment is used for establishing a date for the encounter, When the patient arrives and the visit is about to start, then the appointment will be marked as fulfilled, and linked to the newly created encounter.

We have the following screens for the **NURSE** :

Fig 3A : The nurse logs into the system and finds and selects the patient

The screenshot shows the LibreHealth web application interface. At the top, there is a logo with a white cross on an orange shield followed by the text "LibreHealth". Below the logo is a navigation bar with four items: "Home", "VISIT", "Profile", and "Log Out". The "VISIT" item is currently selected and highlighted in a darker orange. Below the navigation bar, the main content area is titled "FIND PATIENT:". Under this title, there is a section labeled "PATIENT NAME OR IDENTIFIER:" which contains a text input field with the placeholder "SEARCH". Below the search field is a table with three columns: "▼ IDENTIFIER", "▼ NAME", and "▼ ACTIVE STATUS". The table has two rows of data, both containing three asterisks (***) in each cell, indicating a search result. The table is enclosed in a light gray border.

▼ IDENTIFIER	▼ NAME	▼ ACTIVE STATUS
***	***	***

Fig 3B : this screen contains the appointments and encounters of the selected patient, the encounter is created which fulfills a specified appointment.

The webcomponents used (for the provider workflow):

- Create service request
- Create observation

e-prescription : (prescriber)

This workflow involves the prescriber and the pharmacy. The prescriber checks the patient and orders the medication. The pharmacy receives all the orders and completes the request. Creating the screens for the pharmacist is not covered in the project because of the limited time.

The screens for the **Prescriber**:

Fig 5A: the prescriber find the patient

The screenshot shows the LibreHealth web application interface. At the top, there is a logo with a white cross on an orange shield followed by the text "LibreHealth". Below the logo is a navigation bar with three items: "Home", "E-PRESCRIPTION" (which is highlighted), and "Profile Log Out".

Below the navigation bar, there is a section titled "FIND PATIENT:". Inside this section, there is a form with the label "PATIENT NAME OR IDENTIFIER:". Below this label is a search input field with the placeholder text "SEARCH".

Below the search input field, there is a table with three columns: "▼ IDENTIFIER", "▼ NAME", and "▼ ACTIVE STATUS". The table has two rows of data, both containing three dots "...".

CREATE ORDER

Fig 5C : the medication request has a reference to the medication resource

The screenshot displays the LibreHealth E-Prescription interface. At the top, the LibreHealth logo is visible. Below it, a navigation bar includes links for Home, E-PRESCRIPTION (which is highlighted), Profile, and Log Out. A secondary navigation bar contains tabs for MEDICATION and ORDER. The main content area is titled 'CREATE MEDICATION :'. It features a form with the following fields: STATUS (a dropdown menu), BATCH (a text input field with a date picker set to 04/03/2021), FORM (a text input field), ACTIVE (a checked checkbox), STRENGTH (a text input field followed by 'PER' and another text input field), INGREDIENT (a text input field), and CODE (a text input field). A blue 'CREATE MEDICATION' button is positioned at the bottom right of the form.

The medication resource contains the specifications about the medicine, the medication request resource references this resource and does not contain the details about the medicine, hence creation of medication resource entry is essential for a request.

Webcomponents required:

- Create-medication
- Create-medication request

order : (provider)

The order workflow involves the provider and laboratory, the provider checks the patient and orders laboratory tests which the lab receives. The lab then performs the test and creates a report which can be seen by the provider. The screen for the provider is already created in **Fig 4D**, the screens of the laboratory are not covered due to limited time for GSoC.

USING LIT-ELEMENT COMPONENTS WITH REACT:

Creating the react application and importing the polymer components can be done using the webcomponent repo as a git submodule within the main application.

There are a few things to be noted :

- React currently doesn't have a way to listen to native DOM events (preferring, instead, to use it's own proprietary SyntheticEvent system), nor does it have a way to declaratively access the current DOM element without using a ref. The good thing about the current web components we have is that most of event handling is completely done inside the web component repo so we don't usually have to traverse the dom and create event listeners from the react application.
- In case of requirement of event handling we will make use of React's `useRef` hook to create a reference to the native DOM element, React's `useEffect` and `useState` hooks can be further used to communicate with the values property.
- So as long as the communication of react with the dom is limited the application will not require extra modifications, therefore the application will be designed in a specific manner where the lit-components handle all dom related events and react the UI of the EHR.

The Lerna package will be required to be installed as a dependency in the application. lerna.json file will be required as well to configure the lerna options.

Below is the basic sample package.json :

```
{
  "name": "my-app",
  "version": "0.1.0",
  "private": true,
  "dependencies": {
    "lerna": "^4.0.0",
    "react": "^17.0.2",
    "react-dom": "^17.0.2",
    "react-scripts": "4.0.3",
    "web-vitals": "^1.0.1"
  },
  "workspaces": [
    "lh-toolkit-webcomponents/packages/*"
  ],
  "scripts": {
    "start": "react-scripts start",
    "build": "react-scripts build",
    "test": "react-scripts test",
    "eject": "react-scripts eject"
  }
}
```

Below is the sample lerna.json :

```
{
  "lerna": "4.0.0",
  "version": "0.0.1",
  "npmClient": "yarn",
  "packages": [
    "lh-toolkit-webcomponents/packages/*",
  ],
  "useWorkspaces": true
}
```

`lerna bootstrap --use-workspaces` command will be required to install all the dependencies of the packages into the react application and then the components can be imported and used.

Below is a sample App.js file where a webcomponent is imported and used :

```
import './App.css';
import '@lh-toolkit/fhir-human-name/fhir-human-name.js';
import React, { useRef, useEffect } from "react";

function App() {
  const elementRef = useRef();

  useEffect(() => {
    const divElement = elementRef.current;
    console.log(divElement.value);
  });

  return (
    <div className="App">
      <fhir-human-name ref={elementRef}
url="http://hapi.fhir.org/baseDstu2/Patient/175556"></fhir-human-name>
    </div>
  );
}

export default App;
```

Below is the output :

NAME:	Use ▼	Prefix	First Name: Caleb	Last Name: Cushing	Suffix
-------	-------	--------	-------------------	--------------------	--------

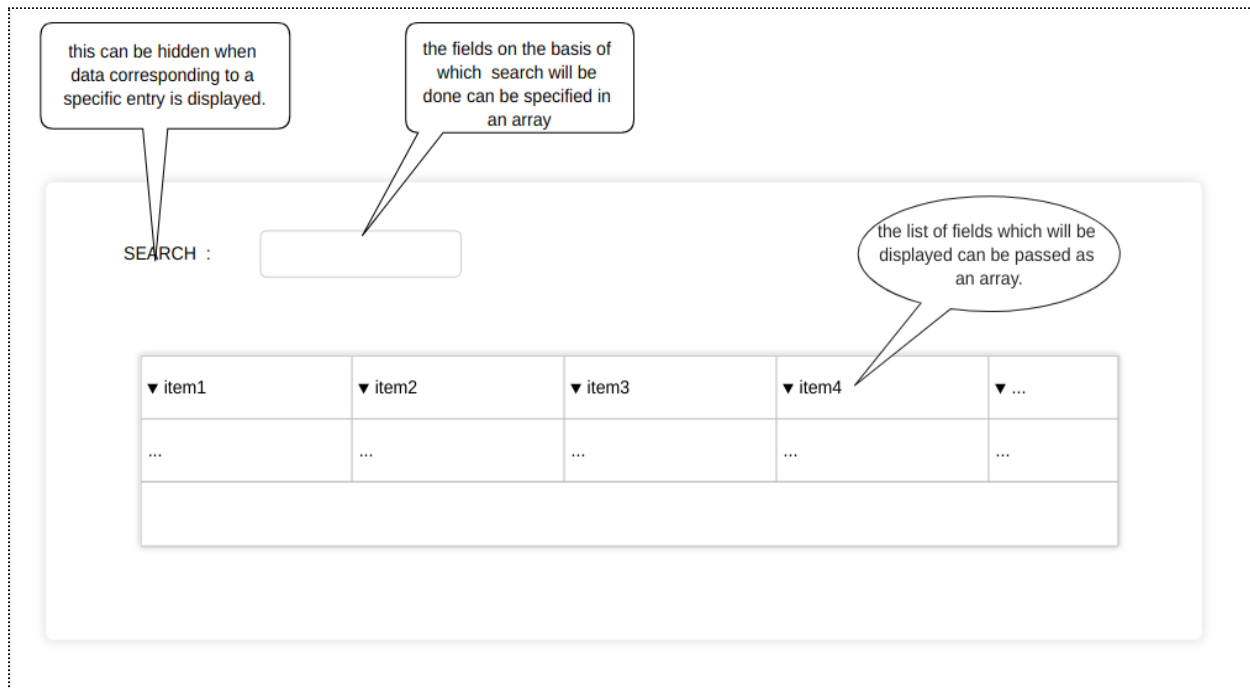

SEARCH AND LOGIN COMPONENT:

Most of the above screens contain a search component. There are two approaches for this implementation:

- Creating search components for each resource based component.
- Create a general search component compatible with all resources.

The repository has a `fhir-search` component from which inspiration can be taken while creating these, the second approach is preferable but if it presents issues the first approach can be taken.

Here is a mockup of the general search component:

Conditional searching is available in FHIR

A general format can be given by :

```
GET [base]/[type]?name=value&...{&_format=[mime-type]}
```

ADMINISTRATOR:

Apart from these screens the EHR must also contain an administrator tab for the admin user, the admin/super user will have all of the privileges and the ability to create new entries into the EHR for the resources. Creating a new user and assigning a role will be the responsibility of the admin, moreover a lot of components which are not getting directly used in the EHR but as a reference can be created by the admin.

COMPONENTS REQUIRED :

Based on the EHR screens displayed in the upper sections, components for the following resources will be required apart from the already existing ones:

- [Schedule](#) |
- [slot](#) |
- [Appointment](#) |
- Medication (field type components already exists, `create` component required)
- Observation (field type components already exists, `create` component required)

- Allergy (field type components already exists, `create` component required)
- [Encounter](#) |
- [Service request](#) |
- [Medication request](#) |

Most of the above mentioned resources have many fields which are of a similar data type, hence creation of field based components for these would be repetitive and unnecessary.

Based on this notion the creation of following data type based web component would significantly reduce the work :

- Reference
- Codeable concept
- Code
- Boolean

The webcomponent repository has Gitlab issues addressing the creation of some of these data type components , these can be worked upon before the inception of the coding period.

The creation of a component is dependent on its requirement for the EHR, the components will be created once its utility and the fields required for the EHR is confirmed.

TIMELINE:

PRE COMMUNITY BONDING PERIOD :

- Contributing to the webcomponent repo primarily to the creation of data type web components.(creation of reference(merge request already present) and codeable concept type will be a high priority)
- Explore more about EHR and FHIR.
- Setup a React application and attempt implementation of one basic workflow.

COMMUNITY BONDING PERIOD :

- Finalise the EHR screens and workflows with detailed UI UX design.
- Familiarize with other participants and mentors.
- Continuous communication with the mentors.
- Develop CD/CI to integrate unit tests and integration tests using SauceLabs.
- Design skeleton PWA to show end-to-end architecture..

CODING PHASE :

WEEK	TASK
Week 1	<ul style="list-style-type: none"> - Setup the project - Implement the basic login, home screen - Implement the check-in workflow
Week 2 and Week 3	<ul style="list-style-type: none"> - Create the web components for the appointment workflow (including docs and tests) - Implement the appointment workflow
Week 4 and week 5	<ul style="list-style-type: none"> - Create the web components for the visit workflow (including docs and tests) - Implement the visit workflow (this includes the order workflow)
Week 6	<ul style="list-style-type: none"> - Complete pending work if any. - Solve bugs and issues
Week 7 and week 8	<ul style="list-style-type: none"> - Create the components for the e-prescription workflow (including docs and tests) - Implement the e-prescription workflow
Week 9	<ul style="list-style-type: none"> - Create the admin page, user profile page and pwa integrations
Week 10	<ul style="list-style-type: none"> - Complete pending work if any. - Solve bugs and issues

PREREQUISITES AND CONTRIBUTIONS

Creating web components for a resource: ([Merge Request](#))

Identify list of missing components : [COMPONENTS REQUIRED](#) :

MERGE REQUESTS :

- Refactoring package structure ([OPEN](#))
- Creating reference type component ([OPEN ISSUE](#))
- Text fixture and component modification ([MERGED](#))

ISSUES :

- Refactoring package structure ([LINK](#))

ABOUT ME

I am a second year student from National Institute of technology tiruchirappalli, India pursuing a degree in Bachelor of Technology. I have been a full-stack developer at my college based organisation [Delta Force](#) since August 2020. I have a keen interest in exploring new things. My interest in working on projects that impact and help people brought me to LibreHealth.

I am willing to commit **45-50 hrs per week** from the beginning of the coding period till July end (till my college remains closed for the summer break), from august beginning till the end of the program I am willing to commit **40-45 hrs per week**.

I do not have any major commitments till late August and hope to spend quality time making open source contributions for LibreHealth.

MAJOR PROJECTS:

PRAGYAN PREMIER LEAGUE | (ReactJs + Golang)

Pragyan Premier League is a virtual cricket league in which matches are algorithmically simulated. The application goes live every year during Pragyan (a college fest).

I was a part of the team that implemented new and real-time features for the application using Golang and Gorilla among other technologies including ReactJs and redux.

The game is live at this point of time : [PPL](#) (as of april 7)

PROJECT MANAGEMENT WEBSITE | (Reactjs + laravel)

Website for management of projects being carried out by Delta Force (college based organisation).

Worked as a full stack developer implementing Laravel in the Backend and React in the frontend. [Link](#)

OPEN SOURCE CONTRIBUTIONS:

Apart from LibreHealth i have made some significant open source contributions for [bench routes](#)

TECH STACK:

Languages:

- C++
- Python
- Javascript
- Golang
- php

web development:

- Nodejs
- Laravel
- Gin
- ReactJs
- redux
- Polymer
- Flask
- nextJs

GSoC

Have you previously participated in GSoC ? when ? under which project ?

-> I haven't participated in GSoC before.

Are you also applying to other projects?

-> NO
